Moreover, all references cited herein are incorporated by reference, whether specifically incorporated or not.

Having now fully described this invention, it will be appreciated by those skilled in the art that the same can be performed within a wide range of equivalent parameters, concentrations, and conditions without departing from the spirit and scope of the invention and without undue experimentation.

While this invention has been described in connection with specific embodiments thereof, it will be understood that it is capable of further modifications. This application is intended to cover any variations, uses, or adaptations of the invention following, in general, the principles of the invention and including such departures from the present disclosure as come within known or customary practice within the art to which the invention pertains and as may be applied to the essential features hereinbefore set forth as follows in the scope of the appended claims.

#### **WHAT IS CLAIMED IS:**

1. A receptor in a mammalian cell useful in the treatment of cancer which inhibits cellular activation by receptors specific for lipid-based tumor associated antigens.
2. The receptor of claim 1 wherein the lipid antigen is a bacterial, fungal, protozoal or mycobacterial antigen.
3. The inhibitory receptor of claims 1 and 2 wherein said inhibitory receptor contains an inhibitory receptor tyrosine-based inhibitory motifs (ITIMs).
4. The inhibitory receptor of claim 1, 2 wherein said receptor is specific for lipid-based tumor associated antigen and/or self MHC or CD1 molecules.
5. A receptor in a mammalian cell wherein said receptor inhibits cellular activation by receptors specific for lipid-based infectious disease associated antigens derived from bacteria, fungi, mycobacterium, parasite, virus, eukaryote or prokaryote antigens in the context of MHC or CD1.
6. A mammalian cell useful in the treatment of cancer wherein the inhibitory receptor for lipid-based tumor associated antigens is deleted or functionally deactivated.

7. A mammalian cell useful in the treatment of cancer wherein inhibitory receptor tyrosine-based inhibitory motifs of the inhibitory receptor for lipid-based tumor associated antigens are deleted or functionally deactivated.

8. A mammalian cell useful in the treatment of cancer wherein the the inhibitory receptor for superantigens associated with self antigens are functionally deleted.

9. A mammalian cell useful in the treatment of cancer wherein the inhibitory receptor for tumor associated lipid antigens and superantigens are deleted or functionally deactivated.

10. The lipid-based tumor associated antigens of claims 1, 2, 4, 6, 9, wherein said lipid-based tumor associated antigen is selected from the group consisting of glycolipids, proteolipids, glycosphingolipids, sphingolipids, gangliosides, phytoglycolipids.

11. The lipid antigens derived from bacteria, mycobacteria, fungi and protozoa marine invertebrates of claim 2 wherein said lipid antigens are selected from the group consisting of glycosylceramides, glycolipids, proteolipids, glycosphingolipids, gangliosides and sphingolipids with inositolphosphate-containing head groups, phytoglycolipids, mycoglycolipids, lipoarabinan and mycolic acid.

12. The sphingolipid antigens of claim 11 wherein the sphingolipid contains inositolphosphate-containing head groups with the general structure of ceramide-P-myoinositol-X with X referring to polar substituents consisting of ceramide-p-inositol-mannose, inositol-1-P-(6)mannose(a1,2inositol-1P-(1)ceramide, (inositol-P)2-ceramide, inositol-P-inositol-P-ceramide, inositol-P-inositol-P-ceramide.

13. The mammalian cell of claim 6-9 wherein said cell is an immunocyte selected from a group consisting of T cell, NK cell, NKT cells

14. A mammalian cell of claim 7 wherein the superantigen is selected from a group consisting of a staphylococcal enterotoxin, a streptococcal pyrogenic exotoxin, mycoplasma arthritides, rabies antigen, clostridial product.

15. A mammalian cell useful in the treatment of cancer wherein the inhibitory receptor for glycan-based tumor associated antigens is deleted or functionally deactivated.

16. The glycan antigens of claim 15 wherein said glycan antigen is selected from the group consisting of peptidoglycans or glycan phosphatidylinositol (GPI) structures.

17. A mammalian cell useful in the treatment of cancer wherein the the inhibitory receptor for superantigen-associated self antigens are functionally deleted or inactivated.

18. The self antigens of claims 17 wherein said self antigens consist of a MHC or CD1 molecule.

19. A mammalian cell useful in the treatment of cancer wherein the inhibitory receptors and/or immune receptor tyrosine based inhibitory motifs which inhibits cellular activation by receptors specific for lipid-based tumor associated antigens and superantigens are deleted or functionally deactivated.

20. The superantigen of claims 17 wherein said superantigen is selected from a group consisting of the staphylococcal enterotoxins SEA, SEB, SEC, SEC1, SEC2, SEC3, SED, SEE, TSST-1 or streptococcal pyrogenic exotoxins, mycoplasma arthritides, rabies virus, mammary

tumor virus, clostridial antigen.

21. A mammalian cell in which the inhibitory receptor for lipid-based infectious disease associated antigens and/or immune receptor tyrosine based inhibitory motifs which inhibits cellular activation by receptors specific for lipid-based infectious disease associated antigens derived from bacteria, fungi, mycobacteria, parasite, virus, eukaryote or prokaryote antigens are deleted or functionally deactivated.
22. The mammalian cell of claims 13, 14, 15, 17, 18, 21 wherein said cell is an immunocyte selected from a group consisting of T cells, NK cells, NKT cells
23. The lipid antigens of claims 21 wherein said lipid-based infectious disease associated antigen or fatty acid is mycolic acid or lipoarabinan,
24. A method of treating cancer in a mammal, said method comprising inactivating or deleting inhibitory receptors or immune receptor tyrosine based inhibitory motifs in immunocytes which inhibit activating receptors specific for lipid-based tumor associated lipid antigens or superantigens.
25. A method of inactivation or deletion of receptors or ITIMs in immunocytes which inhibit cell activating receptors specific for lipid-based tumor associated antigens and superantigens comprising inactivation or deletion of nucleic acids encoding ITIMs.
26. A method for producing a tumoricidal immunocyte population *in vivo* said method comprising allowing a tumor associated lipid antigen and superantigen to contact immunocyte activation receptors specific for tumor associated lipid antigens and superantigens in which inhibitory receptors or ITIMs which inhibit said cell activation by receptors specific for lipid-based tumor associated antigens are inactivated or deleted.
27. A method for producing a tumoricidal immunocyte population *ex vivo*, said method comprising:
- a) allowing a lipid-based tumor associated antigen and superantigen to contact immunocyte activation receptors specific for lipid-based tumor associated antigens and superantigens in which inhibitory receptors or ITIMs which inhibit said cell activating receptors for lipid-based tumor associated antigens are deleted or inactivated.
  - b) administering said tumoricidally activated immunocytes to the host.
28. A method of producing a immunocyte population effective against infectious disease in a mammal *in vivo* said method comprising:
- a) allowing a lipid-based infectious disease associated antigen and superantigen to contact immunocyte activation receptors specific for and superantigens in which inhibitory receptors or ITIMs which inhibit said cell activation receptors specific for lipid-based infectious disease associated antigen and superantigens are inactivated or deleted.
29. A method for producing an immunocyte population effective against infectious disease in a mammal *ex vivo*, said method comprising:
